## AMENDMENTS TO THE CLAIMS:

The listing of claims will replace all prior versions, and listings, of claims in the application:

## LISTING OF CLAIMS:

 (Previously Presented) A method for producing a tube with a compressible peripheral wall, wherein:

injection molding of an integral unfinished tube comprising a tube body, a tube shoulder and a tube outlet using a female die, a core and a neck mold;

demolding the unfinished tube by withdrawing the core while retaining the unfinished tube in the neck mold, and withdrawing the female die;

releasing the unfinished tube from the neck mold; and

flattening and closing the open end of the tube body.

- (Previously Presented) The method of claim 1, wherein a sheet or a sleeve is placed between the core and the female die and caused to contact the core or the female die.
- (Previously Presented) The method of claim 1, wherein a sheet is placed between the core and the neck mold and caused to contact the core or the neck mold.
- (Previously Presented) The method of claim 1, wherein air is supplied through a blow line of the core to between the unfinished tube and the core to reduce adhesion to the core.

-2-

398860.1

- (Previously Presented) The method of claim 1, wherein a demolding bevel of the female die is made larger than a demolding bevel of the core.
- (Previously Presented) The method of claim 1, wherein the female die or the core is provided with a slide coating.
- (Previously Presented) The method of claim 2, wherein the sheet or the sleeve is made of a material having high resistance against the material to be filled into the tube.
- (Previously Presented) The method of claim 2, wherein the sheet or the sleeve is made of a material impermeable to vapor, gas or solvent.
- (Previously Presented) The method of claim 2, wherein the sheet or the sleeve comprises a printed label or a decorative sheet.
- (Previously Presented) The method of claim 2, wherein the sheet or the sleeve is made from a plastically deformable material that counteracts the restoring property of the soft plastic material.
- (Previously Presented) The method of claim 1, wherein the core or a part thereof is supported at the neck mold during at least a part of the injection phase.
- 12. (Previously Presented) The method of claim 1, wherein in a first injection phase, conically centered webs support the core or a part thereof at the neck mold in a centering portion between the tube shoulder and the tube outlet, and, in a fill-up phase, the core or a part thereof is held spaced from the centering portion to fill the portions held free by the webs during the injection phase.

- (Previously Presented) A tube produced according to the method of claim
  wherein ribs are formed near the tube shoulder.
- 14. (Withdrawn) A tube produced according to the method of claim 1, wherein grooves are provided near the tube shoulder to hold the unfinished tube when the injection mold is opened, and that a portion of reduced wall thickness is provided adjoining the grooves.
